Header One

Holy crap! Marker can print **directly to PDF!** That's super good news. A while back I decided to start learning *HTML* and *CSS* because I wanted a clean way to format documents without the bulk of a word processor *(LibreOffice: I can't even)*.

I've tried using Abiword, and I remember liking it okay. If I'm doing something big or important I just use Scribus 1.5.3 — I do love me some Scribus — but it will occasionally crash or displease me. That's kind of a problem... you know 'cause big/important and crashing don't play well together. Seems like there was something about line heights I wanted to change too... :thinking:

So I devoted some time to learning basic web markup. Turns out web markup works better for web documents. Who knew? Everyone I suppose.

Header Two

But it works okay for print. And I've heard more than one thought-leader claim that *CSS* for print is a thing we should do.

This is *markdown.css* with a couple changes:

aleo-lato-md.css

- **h** font is Aleo Bold

    - check size

- **p** font is Lato Regular, *12px*
